UMAT-OTI workbench

Generate and verify derivatives of an Abaqus UMAT, without editing the subroutine.

1. Source | 2. Material model | 3. Derivatives and loading | 4. Run and results

1. Source

Choose the UMAT subroutine to differentiate.

Which UMAT do you want to differentiate?

m3_j2 — 6 stress components, 1 state variable, 4 material constants, small strain

`parameter_sensitivity/models/m3_j2/umat.for` — prefilled from parameter_sensitivity/contracts/m3_j2.json

› Advanced settings — dependency and include roots

Analyse this source

What the source turned out to be

Source form	Routines resolved	Local Newton solves
fixed	1	0

Helper routines: none; the source is self-contained

› Details of the dependency closure
